LISTING OF CLAIMS

This listing of the claims will replace all prior versions, and listings, of claims in the application.

Listing of the Claims:

- 1-30. (Canceled)
- 31. (Previously Presented) A method of providing a point-to-multipoint service in a radio communication system, the method comprising:

generating an identifier for indicating the point-to-multipoint service, wherein the identifier is configured by a radio resource control (RRC) layer;

adding the generated identifier to a data unit which is for the point-to-multipoint service in a medium access control (MAC) layer, wherein the identifier is included in a header of the data unit; and

transmitting the data unit to a mobile terminal via a Forward Access Channel (FACH) or a (Downlink Shared Channel) DSCH.

- 32. (Previously Presented) The method of claim 31, wherein the point-to-multipoint service is a multimedia broadcast/multicast service (MBMS).
- 33. (Previously Presented) The method of claim 31, wherein the identifier is a multimedia broadcast/multicast service (MBMS) radio network temporary identifier (RNTI).
- 34. (Previously Presented) The method of claim 31, wherein the identifier is generated from the radio resource control (RRC) layer.
- 35. (Previously Presented) The method of claim 34, wherein the RRC layer generates the identifier when a radio access bearer is established, and discards the identifier when the radio access bearer is released.
 - 36. (Canceled)
- 37. (Previously Presented) The method of claim 32, wherein the MBMS service is a multicast service.

38. (Previously Presented) The method of claim 31, wherein the data unit is a protocol data unit.

- 39. (Previously Presented) The method of claim 31, wherein the data unit includes an indicator indicating a type of the identifier.
- 40. (Previously Presented) The method of claim 31, wherein the identifier is managed by a controlling radio network controller (CRNC).
- 41. (Previously Presented) A method of receiving a point-to-multipoint service in a radio communications system, the method comprising:

receiving a data unit including an identifier which indicates the point-to-multipoint service via a Forward Access Channel (FACH) or a (Downlink Shared Channel) DSCH, wherein the identifier is included in a header of the data unit and the identifier was configured by a radio resource control (RRC) layer of a network;

identifying the data unit is for the point-to-multipoint service in a medium access control (MAC) layer using the identifier; and

transferring a point-to-multipoint service data of the data unit to an upper layer.

- 42. (Previously Presented) The method of claim 41, wherein the point-to-multipoint service is a multimedia broadcast/multicast service (MBMS).
- 43. (Previously Presented) The method of claim 41, wherein the identifier is a multimedia broadcast/multicast service (MBMS) radio network temporary identifier (RNTI).
- 44. (Previously Presented) The method of claim 41, wherein the identifier was generated from the radio resource control (RRC) layer in the network.
- 45. (Previously Presented) The method of claim 44, wherein the RRC layer generates the identifier when a radio access bearer is established, and discards the identifier when the radio access bearer is released.

46. (Canceled)

. .

- 47. (Previously Presented) The method of claim 42, wherein the MBMS service is a multicast service.
- 48. (Previously Presented) The method of claim 41, wherein the data unit is a protocol data unit.
- 49. (Previously Presented) The method of claim 41, wherein the data unit includes an indicator indicating a type of the identifier.
- 50. (Previously Presented) The method of claim 41, wherein the point-to-multipoint service data of the data unit to the upper layer is a header-removed data unit.
- 51. (Previously Presented) The method of claim 41, wherein the identifier is managed by a controlling radio network controller (CRNC).
- 52. (Previously Presented) The method of claim 31, wherein the configured identifier is transferred from the RRC layer to the MAC layer.
- 53. (Previously Presented) The method of claim 41, wherein the configured identifier was transferred from a RRC layer of a mobile terminal to the MAC layer.
- 54. (Previously Presented) The method of claim 31, wherein the header includes a target channel type field (TCTF).
- 55. (Previously Presented) The method of claim 41, wherein the header includes a target channel type field (TCTF).
- 56. (Previously Presented) The method of claim 31, wherein the identifier is used to identify the point-to-multipoint service among a plurality of point-to-multipoint services.

57. (Previously Presented) The method of claim 31, wherein the identifier is configured by assigning the identifier by the RRC layer.

- 58. (Previously Presented) The method of claim 41, wherein the identifier was configured by assigning the identifier by the RRC layer of the network.
- 59. (Previously Presented) The method of claim 41, wherein the identifier is used to identify the point-to-multipoint service among a plurality of point-to-multipoint services.
